

Immutability checklist

Are you **truly immutable**?

94%

of IT leaders say they currently use **immutable storage**

Not all immutability is created equal — some forms leave a window of exposure.

- ✓ No deletes or overwrites — ever
- ✓ Locked the very second data is stored
- ✓ Support for S3 Object Locking APIs
- ✓ Bulletproof, configurable retention policies
- ✓ Compliance mode for extra fortification

Only object storage provides *true* immutability.

If your “immutable” solution doesn’t check all these boxes, it’s not delivering the protection your data deserves.

NAS/file system snapshots, dedupe appliances, Linux repos and tape — they fall short.
